WORK EXPERIENCE

RTX (Raytheon)

July 2026 - Present

Software Engineer II

Tucson, Arizona

- Developing a C++ class within an existing publisher/subscriber telemetry framework to serialize and parse packet data, conforming to the system's concurrency and resource-management patterns

SemiXR

June 2026 - Present

Technical Co-founder

Tempe, Arizona

- Represented SemiXR at the LEAP East conference in Hong Kong, hardening the Quest 3 build for live floor use and demoing the training platform to prospective semiconductor clients
- Designing and architecting a custom website-embedded immersive XR editor with object hierarchy tracking, inspector panel for managing individual object properties, and a simplified user interface for unfamiliar users
- QA tested and currently bugfixing existing simulation environments within Unity regarding XR interactions and display

Celano Lab

November 2025 - June 2026

Graduate Research Assistant

Tempe, Arizona

- Built a full cloud-to-Quest pipeline enabling secure data transfer between a Google Cloud Run-hosted Typescript dashboard and a Unity-based mixed reality training experience compatible with the Meta Quest 3 and 3s
- Developed interactive UI elements in Unity 6 for visualizing and manipulating ~500k-1M mesh face 3D models and cloud data, using a mixture of mesh preprocessing, quadric edge decimation for mesh face downsampling, and sampled convex mesh generation to balance application performance on a Quest with limited data with experience interactivity
- Created a supplementary annotation tool to import 3D models, visualize and annotate them with labels and descriptions, before exporting them in a localized and parseable state for downstream processing in the main application

Meteor Studio

May 2024 - December 2025

Extended Reality Developer

Tempe, Arizona

- Integrated gameplay elements to delegate tasks and guide players in understanding and practicing real-life procedures, including triaging and applying medical aid to simulated soldiers returning from the battlefield
- Created the Team Performance Architecture, a 5-layered framework designed to collect and transmit data on team performance, including movement, view frustum-based visual activity tracking, and other various performance metrics
- Engineered multiprocessed data collection pipelines integrated into downstream analysis tools managed by MongoDB and Kafka to assess, evaluate, and improve player team dynamics and effectiveness in future instances via data streaming
- Built interaction systems for a pre-veterinary training experience targeting modern processes for evaluating pets in VR with a focus on interactivity and information retention

PROJECTS

Spherical Conformal Harmonic Map Calculator | (C++, Halfedge Data Structure)

August 2024 - December 2024

- Projected brain meshes onto the unit sphere via Gauss map initialization, then minimized Tuette energy through gradient descent on the mesh Laplacian with tangent-plane projection to produce a topology-preserving base mapping
- Refined the mapping into a conformal (angle-preserving) parameterization by minimizing harmonic energy using cotangent weights derived from the original mesh geometry, with area-weighted recentering for numerical stability

Educational Stock Trading Simulation Applied Project | (Flask, SQLite, Unity, C#)

March 2025 - July 2026

- Developed a historically grounded stock-trading simulation that teaches investing fundamentals through real financial data, NPC dialogues, and interactive trading terminals that display indicators like SMA50 and RSI for realism
- Developed a Flask + SQLite backend for data persistence and dynamic market event generation for efficient data transfer
- Built an immersive Unity-based gameplay system with C#, incorporating historical news summaries, procedurally generated NPC dialogues and a knowledge graph for player performance analysis, feedback and reactive lessons

SKILLS

XR/Graphics: Unity 6, Meta All-In-One SDK, Halfedge Data Structures, HLSL, GLSL

Backend & Data: Google Cloud Run, SQLite, .NET, Flask

Languages: C#, C++, Java, Python, SQL, Javascript, HTML

EDUCATION

ARIZONA STATE UNIVERSITY - Barrett Honors College

May 2026

- B.S. in Computer Science - GPA 3.93
- M.S. in Computer Science (Media Arts and Engineering) - GPA 3.97
